804527 / 804584 CSC Differences

On some Renault vehicles, there can be a choice of two concentric slave cylinders (CSC) fitted, 804527 and 804584.

These two CSC's use the same mounting locations inside the gearbox but there are differences in the hydraulic pipe and connector design which will mean only one of the CSC's are suitable. Care must be taken when replacing to ensure the new CSC matches exactly to the original design.

There are visual differences between 804527 and 804584 and this bulletin has been produced to assist in choosing the correct CSC first time.

- 804584 uses a 'twin' spring clip to secure the hydraulic pipe
- 804527 uses a 'single' spring clip to secure the hydraulic pipe

Below are images of the two CSC's, with the visual differences highlighted.
