## Difference between Clutch Kits

A common query the Valeo Technical Hotline receive is regarding the bearings in Citroen and Peugeot clutch kits and the bearing that is supplied with them. In most cases a clutch has already been supplied with the clutch cover and friction plate matching the kit being replaced, but the bearing is incorrect.

Before supplying a clutch kit a quick check of the release mechanism will determine what clutch to supply. There are two types of clutch mechanism used; a '**hydraulic operated release mechanism**' and a '**cable operated release mechanism**'.

Please use the information below to see clutch equivalents in hydraulic and cable operated release mechanisms.

826245 - Hydraulic clutch
